PROFESSIONAL SUMMARY

Data Analyst specialising in midstream energy analytics, with hands-on industry experience building Power BI dashboards and delivering client-ready reporting across HR analytics, sentiment analysis, and e-commerce research. Flagship project analysed 500 telemetry batches in DuckDB with sub-millisecond SQL queries, applying volumetric mass-balance loss reconciliation and anomaly detection logic for real-time operational risk monitoring. Skilled in SQL (joins, CTEs, window functions), Python-based statistical analysis, and end-to-end EDA. Seeking to relocate to the UAE to apply data analytics expertise within a fast-paced, data-driven business environment.

PROFESSIONAL EXPERIENCE

Data Analyst | SDL Creative Groups

Tools: Power BI · Python · SQL · Excel · n8n

Apr 2026 – Present

- Built interactive Power BI dashboards from client-provided datasets, delivering KPI tracking and drill-through reporting across 3 end-to-end analytics engagements spanning HR analytics, sentiment analysis, and e-commerce research.
- Conducted client sentiment analysis on customer reviews using Python, surfacing key improvement areas that directly informed client business strategy and product direction.
- Designed and deployed n8n automation workflows to streamline recurring data processing tasks and integrate tools across client delivery pipelines.
- Analysed departmental workforce performance data, identified an experience gap in an all-fresher team, and recommended a senior hire that resolved a recurring project delivery issue.
- Led competitive research across dozens of e-commerce platforms and user review sites, translating customer pain points into concrete feature requirements for the development team.
- Applied Python for data cleaning, transformation, and analysis to support fast-paced, cross-functional client delivery within Agile-style delivery cycles.
- Developed backend components for client web applications and contributed to offline desktop software solutions, supporting feature builds outside the core analytics workstream.

Web Development Intern | E-Soft IT Solutions

2024

- Developed and tested responsive web pages using HTML and CSS within Agile-style sprint cycles, building early exposure to structured, deadline-driven software delivery workflows.
- Collaborated with a small development team to translate design requirements into functional, tested front-end code.

DATA ANALYTICS PROJECTS

ADNOC Midstream Operations & Mass-Balance Intelligence System

Independent Flagship Project · 2026

Tools: DuckDB · SQL · Python · Power BI (DAX) · Custom CSS · Anomaly Detection

- Built an end-to-end midstream operations intelligence system analysing 500 telemetry batches, with DuckDB SQL queries executing in under 1ms to support near-instant operational reporting.
- Engineered volumetric mass-balance loss reconciliation logic comparing inlet and outlet volumes per batch, quantifying and tracing volume loss across midstream flows.
- Implemented rule-based anomaly detection to flag batches breaching loss-tolerance thresholds, enabling real-time operational risk monitoring and prioritised follow-up.
- Designed a custom-CSS-styled Power BI dashboard with KPI tracking and risk indicators, giving operations stakeholders a clear, executive-ready view of loss and anomaly status.

Template-Based Interactive Dashboard Builder

Final Year Project · 2025–2026

Tools: Power BI · Python · Excel · Data Modelling | Live: visorybi.vercel.app

- Engineered a BI automation system converting structured datasets into interactive Power BI dashboards using reusable KPI templates, significantly reducing manual dashboard build time.
- Applied rigorous ETL and data wrangling pipelines to ensure reporting accuracy and consistency across multiple dataset formats.
- Standardised KPI layout templates enabling scalable, reproducible reporting aligned with enterprise BI standards.

Web Data Analysis & Dashboard Automation (Data-Tidy)

Independent · 2025

Tools: Python · Excel · Power BI | Live: data-tidy.vercel.app

- Built an end-to-end ETL pipeline to collect, clean, and analyse 500+ structured records, surfacing trends, outliers, and actionable patterns.
- Designed 3 interactive Power BI dashboards with KPI tracking, drill-through navigation, and dynamic filters enabling stakeholder self-service analytics.
- Automated key data transformation steps via Python scripting, improving reporting efficiency and eliminating repetitive manual processing.

DevTrust Protocol — HR Analytics Dashboard

Independent · 2025

Tools: Python · Excel · Power BI · Streamlit | Live: devtrustprotocol.streamlit.app

- Analysed employee datasets covering attendance patterns, salary distribution, and departmental performance indicators to support workforce planning decisions.
- Developed KPI metrics and built interactive Power BI visualisations with ranked performance tables and automated reporting outputs.
- Deployed as a live Streamlit application to demonstrate real-world HR analytics in an accessible, shareable format.

Data Centre Thermal Optimization

Independent Research · 2024

Tools: Python · Pandas · Statistical Regression

- Identified thermal bottlenecks across high-density data centre cooling zones by analysing server utilisation and environmental sensor records.
- Built a Python-based predictive analytical model using Pandas and statistical regression to simulate cooling load under variable utilisation scenarios.
- Achieved a simulated 15% improvement in cooling efficiency; formalised findings in a structured technical report demonstrating data science applicability to sustainable infrastructure.
